## 1.1 Do Now

Figure out what the following code does.

```
1 public void printme(int n) {  
2     if (N > 0) {  
3         printme(n - 1);  
4         System.out.println(n);  
5     }  
6 }
```

It should print out an increasing sequence of numbers from 1-N.

## 1.2 Stack and ROP

The stack on top is the current function, and each layer beneath that is the function that called the current function.

## 1.3 Recursion

Simple recursive problem: FACTORIAL

Hallmarks of a recursive solution:

- Base Case: thing that stops the program, simple case you know the answer of. In the case of factorials,  $\text{factorial}(0) = 1$
- Reduction Case: You need to alternate the variable in some sort of way, for example, we should do  $n * \text{factorial}(n - 1)$
- Recursion: function A need to eventually call A

Final code:

```
1 public int factorial(n) {  
2     if (n == 0) {  
3         return 1;  
4     }  
5     else {  
6         return n * factorial(n - 1);  
7     }  
8 }
```
